

CHUTIAN CHEN

cchen@connect.ust.hk • cct15.github.io • github.com/cct15 • Hong Kong

EDUCATION

Hong Kong University of Science and Technology <i>Ph.D. candidate</i>	2022 – present
Columbia University <i>M.S. in Computer Science</i>	2019 – 2021
Tsinghua University <i>B.Eng. in Engineering Physics</i>	2015 – 2019
Peking University <i>B.S. in Economics</i>	2016 – 2019

EXPERIENCE

Futuristic Group Ltd — Founder	2025 – present
- Founded a research lab that trades its own book, running systematic strategies and on-chain market making, with tokenized real-world assets as its main line. - The lab's work is a self-evolving research engine: hypotheses are generated and tested automatically under a frozen evaluation protocol the engine cannot modify, with unseen data managed as a logged, depletable budget. - Built the research and trading stack end to end: data infrastructure across venues, a validation framework with walk-forward testing and a pre-deployment audit, and live monitoring that ties realised PnL back to the backtest that authorised the position. - Lead strategy research, and set the standard a signal has to clear before it is allowed to trade capital.	
Quanta Edge — Co-founder	2026 – present
- Ultra-low-latency trading in Chinese index futures and equity markets, with FPGA-based execution on colocated infrastructure. - High-frequency market making for tokenized real-world assets on-chain, together with the low-latency execution stack beneath it. - Set the research agenda on the strategy side and build out the trading and engineering team.	
Graphen, Inc., Market Intelligence — Research Assistant	2020
- Reinforcement-learning models for high-frequency FX trading, working on model stability and return. - Introduced Reinforcement Sensitivity Theory from psychology into the trading model, matching client risk profiles to strategies.	
Megvii, Algorithm Department — Algorithm Intern	2018 – 2019
- Fundamental research on neural networks, focused on the robustness of deep networks used for face recognition. - Integrated a decision function into the existing model for optimisation and sample visualisation.	

RESEARCH

Evaluation design for automated search: held-out data as a logged, depletable budget; zero-alpha calibration of a research pipeline against itself; the boundary between what a self-improving research system may change and what it must not. Also market microstructure at sub-second horizons. Detail at cct15.github.io/research.

HONORS

Hong Kong PhD Fellowship	2022
Academic Excellence Award, Tsinghua University	2016 – 2018
